ABSTRACT

The “Gira Musical” project emerged as a need to build material, didactic content and scientific initiation in music for students in public schools in the State of Paraíba. In the 21st century we have entered a process of popularization of digital media. In recent years, the need to restructure teaching or to "reengineer" educational institutions has become a necessity and there is finally a perception that the application of digital technologies is beginning to translate into effective and global results. In this sense, there is a need for a reformulation of pedagogical practices in basic education, so that students learn the processes of technological changes that accompany the job market. These reformulations of pedagogical practices can be carried out with digital media, such as: Facebook, WhatsApp, Instagram, or through software, which in the case of the arts discipline can be Paint, Finalle, Pure Data, among others. This project managed to continue in the months resulting from the Covid-19 pandemic, as classes take place via an online platform, so there was no major damage to the initial structure. The aim of the project is to achieve a significant number of musical literacy in the Paraíba school community and promote scientific initiation of students in public schools.

Key words: Gira Musical; Scientific research; Musical Literacy
